

Task:

- Create **two** middleware functions that deal with **password hashing**.
- Use the **BcryptJS** npm package.
- One middleware should **hash the password** before it is stored in the DB on **user creation**.
- The second middleware should **decrypt** the hashed password to compare against the original password on a **login route**.

Stretch goal – Create middleware that checks if a email is structured like an actual email (name@domain.com).
